

RP5000 database: Dutch registry for Inherited Retinal Dystrophies

The RP5000 database is a national, web-based, patient registry (research database) with the aim to combine the clinical and genetic information for inherited retinal diseases in a standard form across the country. Patient information remains property of the person/center that supplies the information, but can be shared for research purposes after assessment of the research question. The database will be used to select patients for future clinical trials.
